What does it take to “melt” protons and neutrons into quarks and gluons?

What does it take to “melt” protons and neutrons into quarks and gluons?

- **Microseconds after the big bang**, it was so hot that protons could not form!

- Today we can recreate these extreme conditions in **high-energy collider experiments**

Today's focus: quarks and gluons, particles of the strong nuclear force

Creating the hottest temperatures in the universe: colliding heavy nuclei

82 protons and 126 neutrons!

- Temperatures **250,000 times** the core of the sun
- In a size **10,000 times smaller** than an atom

Produces a novel phase of matter of free quarks and gluons: the quark-gluon plasma

Quarks and gluons: an unusual attraction

Ordinary forces:
decrease in strength with distance

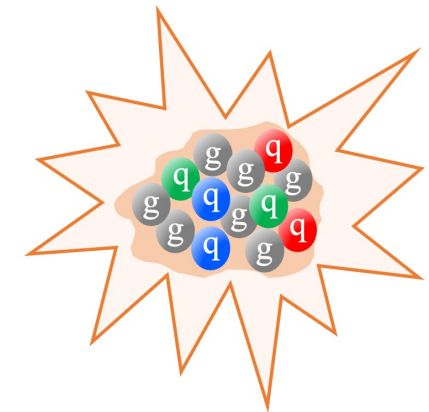

Quarks and gluons:
*increase** in strength with distance!

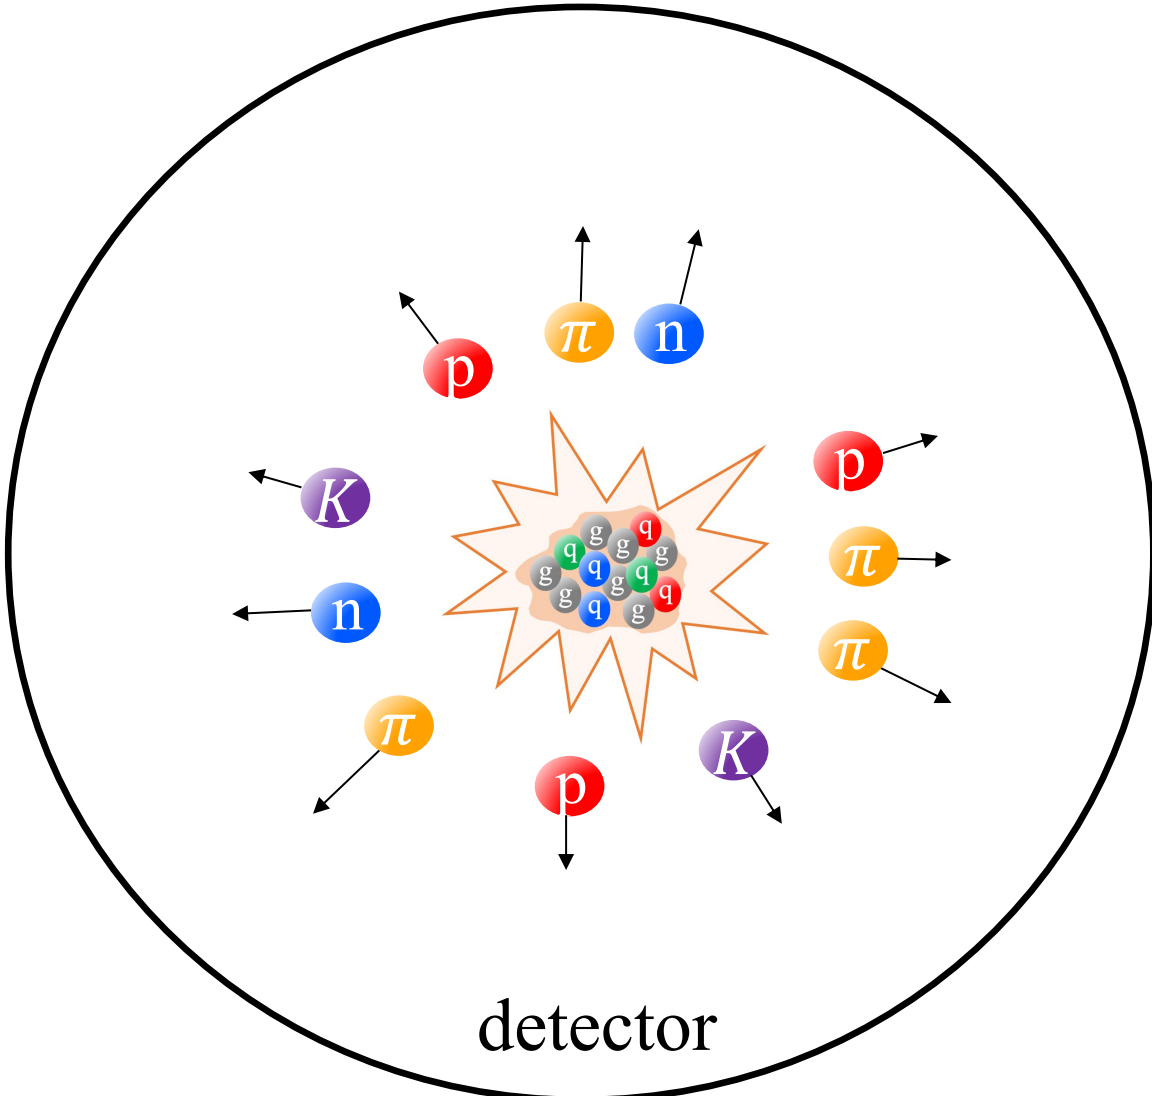

What is the material like when you bring lots of quarks and gluons together? How strong are their interactions?

Many thought it would be a gas, but it's the most strongly-interacting liquid!

How can we study the quark-gluon plasma in heavy-ion collisions?

Properties of a material of quarks and gluons

Weak interactions (gas)

- Equal expansion in all directions

Strong interactions (liquid)

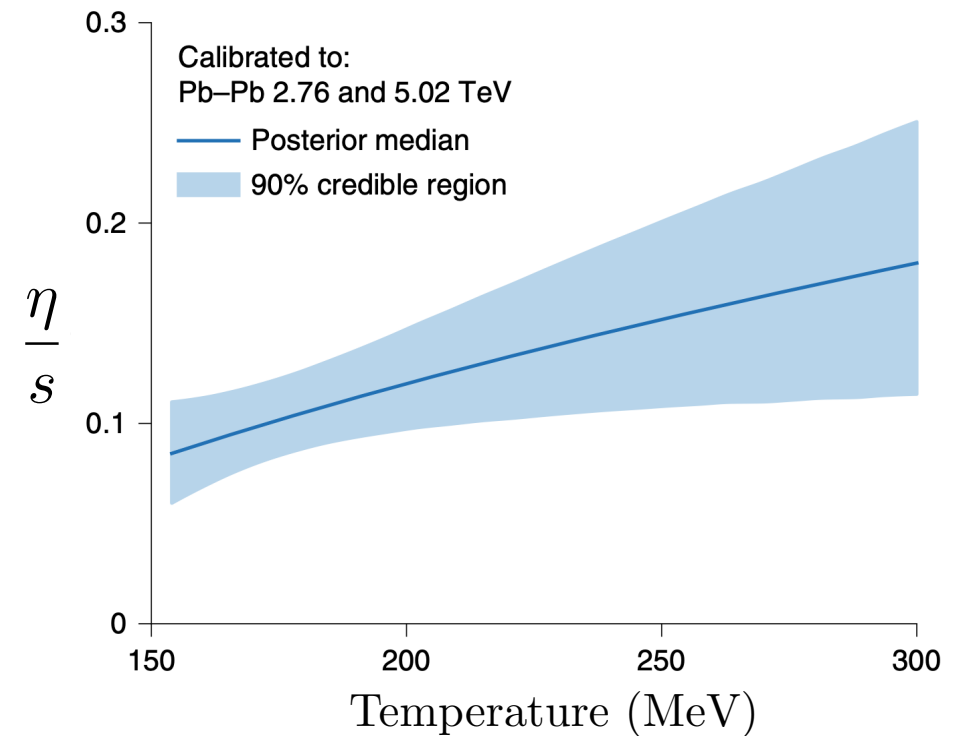

- Pressure-driven expansion

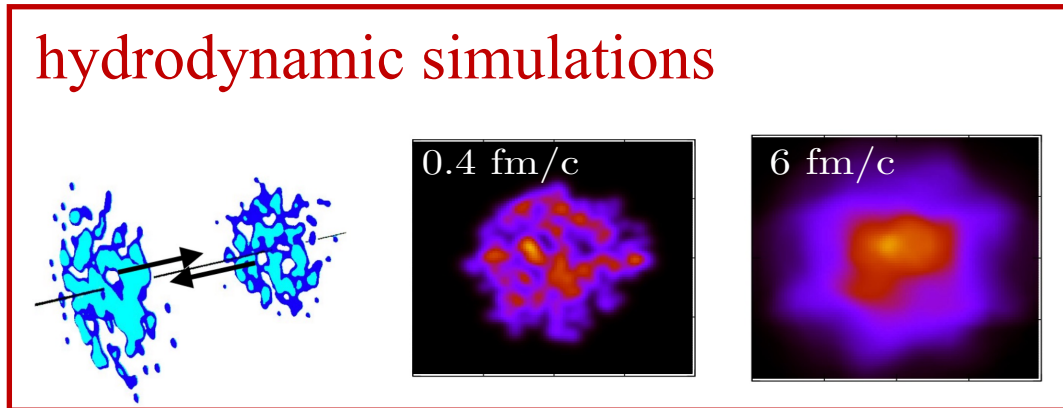

Overlap of nuclei colliding

Frontier: how do quarks and gluons interact to form the quark-gluon plasma?

This phase holds key insights on the many-body physics of quarks and gluons

If quarks and gluons interact..

very weakly

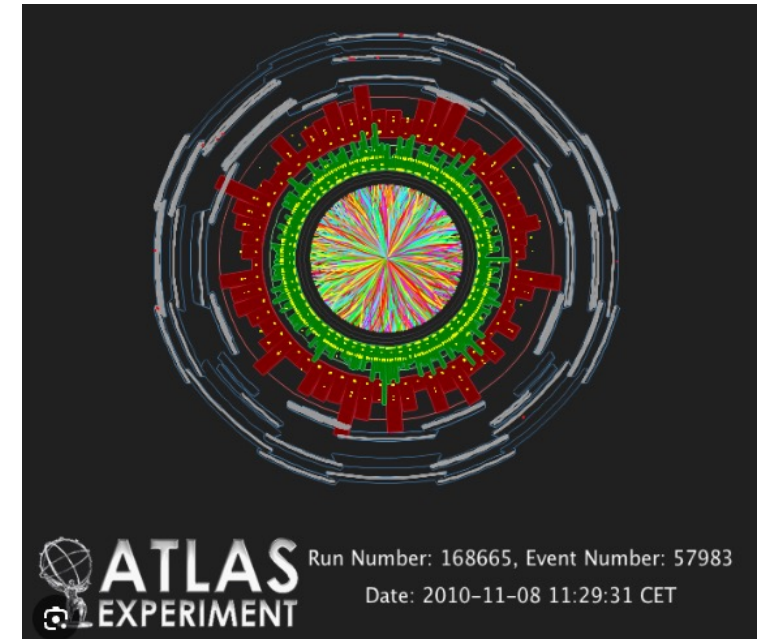

strongly?

turbulent thermalization

general features of equilibration at intermediate and strong coupling

How can we study the quark-gluon plasma in heavy-ion collisions?

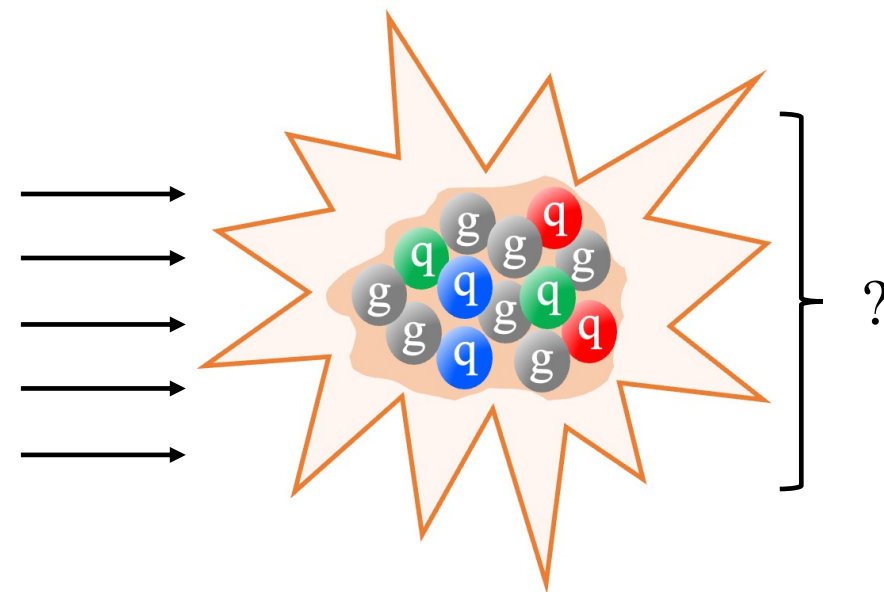

How can we study the quark-gluon plasma in heavy-ion collisions?

A key strategy to discover the structure of a material is to scatter high-energy particles on it

Used to discover the nucleus inside atoms

Ideally...

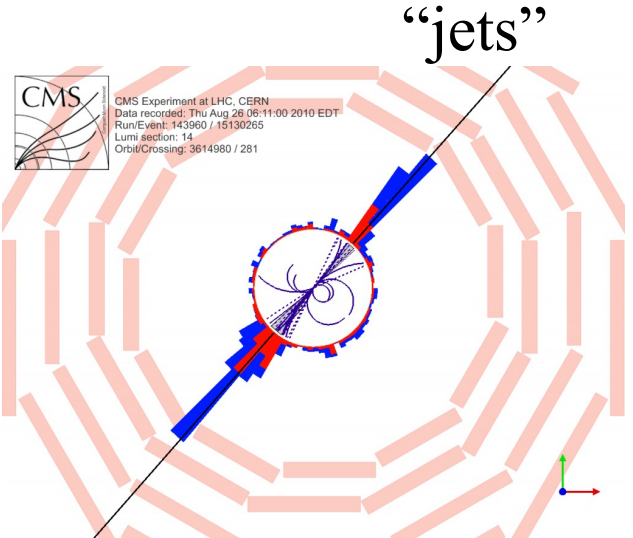

Unfortunately the quark-gluon plasma is too short-lived to achieve this with particles external to the collision itself

Scattering high-energy particles off the quark-gluon plasma

proton collisions

heavy-ion collisions

Using jets to study the structure of the quark-gluon plasma

Key signatures of the formation of quark-gluon plasma and its interaction with jets

Compared to proton collisions, in heavy-ion collisions there are

- Half as many jets
- Increased momentum imbalance between back-to-back jets

Jets: built out of quarks and gluons

Building blocks of a jet

quark splitting into quark and gluon

gluon splitting into two gluons

gluon splitting into two quarks

→ Spray of particles in the detector

HUGE variety of jets from all different ways to assemble these building blocks

Each interacts in a unique way with the quark-gluon plasma depending on the building blocks

Using jets as a controlled probe of the quark-gluon plasma

gluons should interact more strongly, but by how much is a key property of the medium

Measure differences in how charges (quarks and gluons) interact with the quark-gluon plasma!

Using jets as a controlled probe of the quark-gluon plasma

"Regular" jets:

Quarks and gluons
become bound

can't measure which particles were quarks or gluons

Exception: special types of quarks (heavy ones)
can be used to see back in time how a jet formed

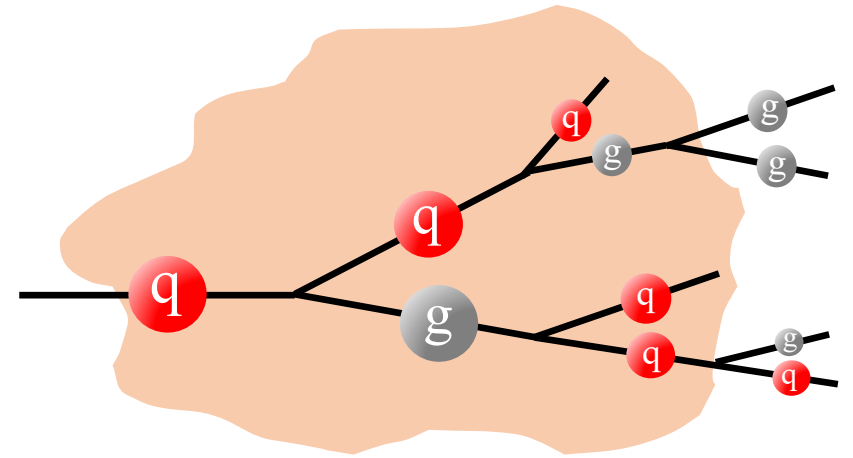

can know the building blocks of these jets in detail!

Attems, JB, Innocenti, et al [2203.11241, 2209.13600]

Unique opportunity for precision understanding of the medium interaction by carefully
constraining the properties of the high-energy probe

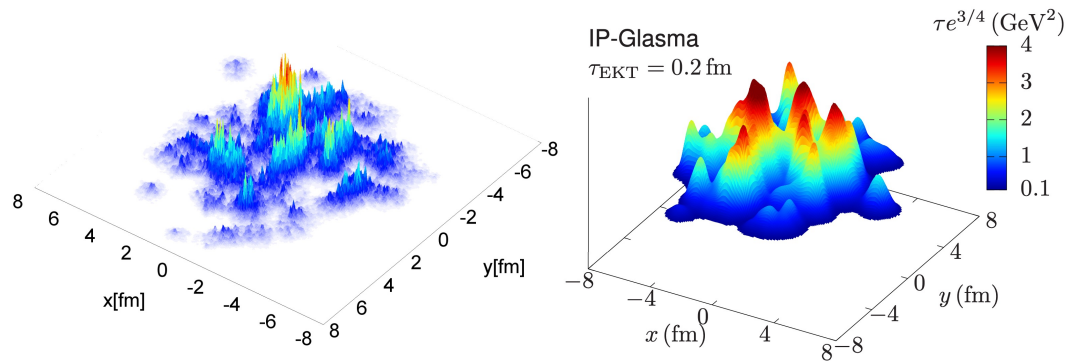

Coming full circle: bringing together jet measurements and hydrodynamics

In between...

Equilibration of the medium itself

Equilibration in the wake of jets

Significant theoretical effort and new experiments aim at addressing this intersection

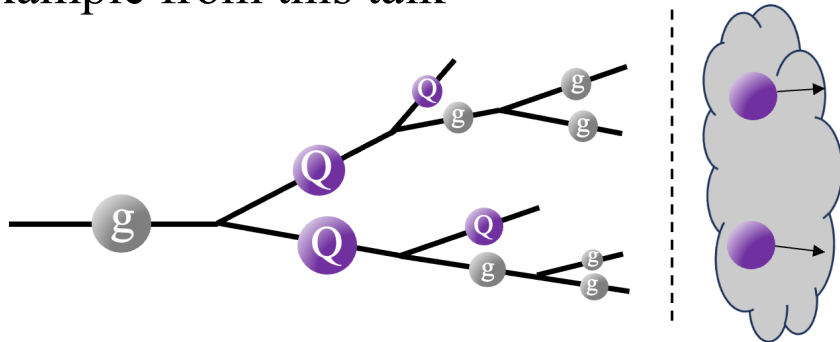

Zooming out: the open questions driving the future

- Can we access the microscopic structure of the quark-gluon plasma using jets?

Necessitates excellent control over the properties of the jets themselves

Rare processes can hold unique insights, but need a lot of collisions to observe them
