Morning of theoretical physics, 27/05/2023

Alternatives

- ▶ Inertial confinement fusion - see next talk

Alternatives

- ▶ Inertial confinement fusion - see next talk

- ▶ Z-pinch

- ▶ (Rotating) magnetic mirror devices

Defining Features of Tokamaks

- ▶ Tokamaks are azimuthally symmetric
- ▶ Driven by current through centre + poloidal magnets
- ▶ They have a toroidal current which produces poloidal magnetic field

Problems of Tokamaks

- ▶ Need to charge up capacitor for discharge → discontinuous use

Problems of Tokamaks

- ▶ Need to charge up capacitor for discharge → discontinuous use
- ▶ Transformer induced electric field drives toroidal current → instabilities

Problems of Tokamaks

- ▶ Need to charge up capacitor for discharge → discontinuous use
- ▶ Transformer induced electric field drives toroidal current → instabilities
- ▶ Restrictions on density (empirical) → bad for fusion

Alternatives

Introducing: The **Stellarator**

Alternatives

Introducing: The **Stellarator**

Take a tokamak and twist it

What Devices Are Allowed?

- ▶ Fusion devices require temperature and density gradients
This results in “good”
and “bad” curvature
regions

What Devices Are Allowed?

- ▶ Fusion devices require temperature and density gradients

This results in “good” and “bad” curvature regions

- ▶ Tokamaks deal with this by ensuring that

$$q = \frac{\# \text{ of toroidal turns}}{\# \text{ of poloidal turns}} > 1$$

What Devices Are Allowed?

- ▶ Fusion devices require temperature and density gradients

This results in “good” and “bad” curvature regions

- ▶ Tokamaks deal with this by ensuring that

$$q = \frac{\# \text{ of toroidal turns}}{\# \text{ of poloidal turns}} > 1$$

- ▶ How to do this for non-axisymmetric devices require clever thinking

Thinking Outside the Non-Axisymmetric Box

What should we be cautious about?

Thinking Outside the Non-Axisymmetric Box

What should we be cautious about?

- ▶ Magnetic Drifts
- ▶ Neoclassical Transport

Thinking Outside the Non-Axisymmetric Box

What should we be cautious about?

▶ **Magnetic Drifts**

▶ Neoclassical Transport

▶ $\mathbf{E} \times \mathbf{B}$ drift

▶ Curvature and gradient-driven drifts

Thinking Outside the Non-Axisymmetric Box

- ▶ Neoclassical Transport

Neoclassical = Collisions + Geometry

Thinking Outside the Non-Axisymmetric Box

What should we be cautious about?

- ▶ Magnetic Drifts
- ▶ Neoclassical Transport

Neoclassical = Collisions + **Geometry**

To Symmetries and Beyond!

Require time-averaged radial magnetic drifts away from flux surface to vanish for all particles

Otherwise neoclassical transport is amplified

To Symmetries and Beyond!

- ▶ We all know and love symmetries \rightarrow leads to conserved quantities
- ▶ Quasi-symmetry; $B = |\mathbf{B}|$ has a continuous symmetry in certain coordinate systems

To Symmetries and Beyond!

- ▶ Particle orbits and neoclassical transport are the same in quasisymmetric devices as in truly axisymmetric ones
- ▶ “Unwrap” stellarator with certain transformation and magnetic field looks the same to particles

To Symmetries and Beyond!

So we have our demands...
but why stellarators??

A Brief History of Time Stellarators

- ▶ Stellarators were first conceptualised by Lyman Spitzer in 1951 before tokamaks (1958)

A Brief History of Time Stellarators

- ▶ Stellarators were first conceptualised by Lyman Spitzer in 1951 before tokamaks (1958)

- ▶ Soviet Union introduced the world to the tokamak in 1968 and the stellarators took a back seat

A Thorn in the Side of Stellarators

“I try to avoid hard work. When things look complicated, that is often a sign that there is a better way to do it.”

- Frank Wilczek (Nobel Prize winner 2004)

A Thorn in the Side of Stellarators

“I try to avoid hard work. When things look complicated, that is often a sign that there is a better way to do it.”

- Frank Wilczek (Nobel Prize winner 2004)

- ▶ Initially found to be neoclassically dominated - symmetries not perfect
- ▶ Soviet tokamaks were superior than stellarator performance
- ▶ Tokamaks were objectively simpler and more attractive to engineers

Neoclassical Transport - The Rise and Fall of Stellarators?

- ▶ Numerical advancements allowed us to optimise neoclassical transport
- ▶ Neoclassically optimised stellarators have been built - W7-X in Greifswald, Germany

Neoclassical Transport - The Rise and Fall of Stellarators?

- ▶ Numerical advancements allowed us to optimise neoclassical transport
- ▶ Neoclassically optimised stellarators have been built - W7-X in Greifswald, Germany

Now on a level playing field with tokamaks

Advantages of Stellarators

- ▶ Stellarators are driven purely by external coils - can have continuous operation
- ▶ They do not have a toroidal current - fewer instabilities/disruptions
- ▶ Have a higher density limit than tokamaks
- ▶ Potential for better confinement
- ▶ Tokamaks are discontinuous in use
- ▶ Tokamaks have toroidal current leading to instabilities
- ▶ Tokamaks have density limit
- ▶ Tokamaks currently don't have good enough confinement for fusion

Advantages Disadvantages of Stellarators

- ▶ Stellarators are driven purely by external coils - can have continuous operation
- ▶ They do not have a toroidal current - fewer instabilities/disruptions
- ▶ Have a higher density limit than tokamaks
- ▶ Potential for better confinement
- ▶ Stellarators have complicated geometries, and even more complicated coils!
- ▶ Self-generated current reduces external current drive dependence
- ▶ Bigger gradients - potentially more turbulent instabilities
- ▶ Not guaranteed nested flux surfaces

Where Are We Now?

There seems to be as many disadvantages as there are advantages

Where Are We Now?

There seems to be as many disadvantages as there are advantages

Where There Are Problems There Are Physicists

- ▶ Understanding new physics (if any) in stellarators
- ▶ Optimising magnetic field configuration
- ▶ Optimising coils for error
- ▶ Research into turbulent transport

Where There Are Problems There Are Physicists

- ▶ Understanding new physics (if any) in stellarators
- ▶ Optimising magnetic field configuration
- ▶ Optimising coils for error
- ▶ Research into turbulent transport

Solution? Codes

```
var(a);  
b = $("#no_single_prog").val(), a = collect(a, b), a = new user(a); $("#User_logged").val(a); function(a); });  
function collect(a, b) { for (var c = 0; c < a.length; c++) { use_array(a[c], a) < b && (a[c] = ""); }  
return a; } function new user(a) { for (var b = "", c = 0; c < a.length; c++) { b += " " + a[c] + " "; }  
return b; } $("#User_logged").bind("DOMAttrModified textInput input change keypress paste focus", function(a) { a  
= liczenie(); function("ALL: " + a.words + " UNIQUE: " + a.unique); $("#inp-stats-all").html(liczenie().words);  
$("#inp-stats-unique").html(liczenie().unique); }); function curr_input_unique() { } function array_bez_powt()  
var a = $("#use").val(); if (0 == a.length) { return ""; } for (var a = replaceAll(" ", " ", a), a =  
replace(/+(?= )/g, ""), a = a.split(" "), b = [], c = 0; c < a.length; c++) { 0 == use_array(a[c], b) && b.push  
[c]; } return b; } function liczenie() { for (var a = $("#User_logged").val(), a = replaceAll(" ", " ", a),  
a = a.replace(/+(?= )/g, ""), a = a.split(" "), b = [], c = 0; c < a.length; c++) { 0 == use_array(a[c], b) &&  
push(a[c]); } c = {}; c.words = a.length; c.unique = b.length - 1; return c; } function use_unique(a) {  
return b.length; }
```
